theClubForum iteration one PRD

Scope and implementation plan • November 1, 2026

Build club discovery, events and saved follows inside theCourseForum. This six-page brief replaces the long PRD for implementation planning. Pages 2–6 each cover one assigned feature and its approved design.

Release scope

Students can browse categorized clubs and existing reviews, inspect events in Month or List view, choose clubs and exclude events from an .ics download, and sign in to save followed clubs. Hoos Involved supplies public data; tCF administrators fill gaps through Django admin.

Deferred: week view, student-to-student follows, personalized event feeds, email subscriptions, club officer editing, RSVP and live calendar subscriptions. Following saves a club only; export selection is separate.

Shared implementation requirements

- Extend the current Django application. Reuse base.html, the shared header, browse forms and result partials, club.html, profile.html, login modal, messages and pagination. Keep tCF branding, both themes and current course/review behavior.
- Sunny supplies stable organization and event-occurrence IDs. Hani owns the shared event query and detail contract; Hanzhe and Abhi reuse it for Month and export. Store co-hosts once per event and deduplicate by occurrence ID.
- Use timezone-aware UTC instants and display America/New_York. Store all-day spans as dates with an exclusive end. Query interval overlaps so overnight and multi-day events remain visible.
- Coordinate additive migrations for source metadata, interests, events/hosts and ClubFollow. Preserve existing Club IDs, categories and reviews. Admin overrides must survive imports; unknown values must remain distinct from zero or false.

Integration and release checks

Agree on shared models and fixtures first, build the five features, then connect real imports and authentication. Launch requires approved API access and sample payloads, verified import visibility/cancellation rules, all feature acceptance criteria, and the repository’s existing lint, formatting, type and Django test checks.

Check desktop and mobile at 390 px, both themes, keyboard access, loading/empty/error states and modal focus. Test downloaded files in Google Calendar, Apple Calendar and Outlook. API access is still being arranged; import cadence and export limits must be confirmed before launch.

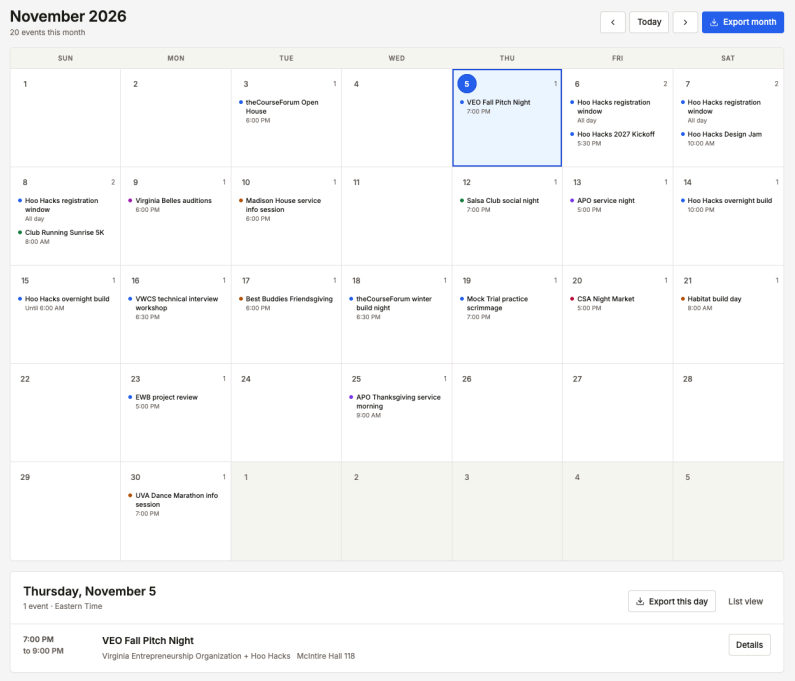

Design and code baseline

Approved designs are saved in theClubForum in OpenDesign Cloud. The screenshots here are excerpts with illustrative data. The prototype’s simulated sign-in and browser storage must be replaced by existing authentication and database persistence.

Approved design review • Reviewed codebase

1 Month calendar

Assigned to Hanzhe • Charka123

Approved month grid and selected-day agenda. Shared filters appear above this excerpt.

Scope

A seven-day month calendar with Previous, Next and Today, shared event filters, event details and export entry points. On mobile, use a compact calendar with a readable selected-day agenda. Week view is deferred.

Implementation

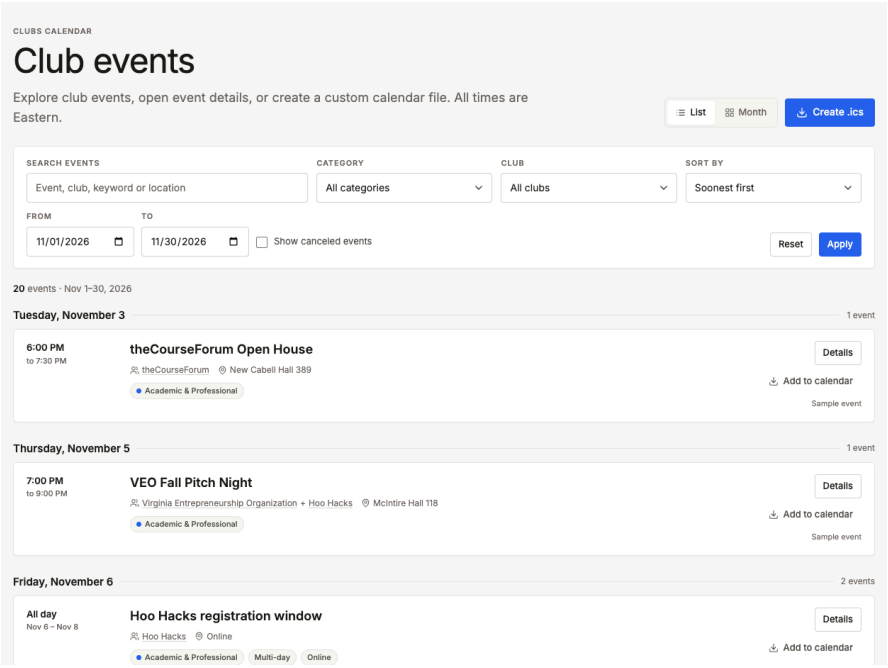

- Build one dated month component for both browsing and export. Reuse base.html, mode helpers and existing modal behavior; the weekday course calendar cannot supply club date logic unchanged.
- Consume Hani’s shared occurrence query without list pagination. Render all-day, overnight, canceled and co-hosted events; count unique occurrences and provide a +N more action for crowded days.

Acceptance criteria

- Weekends, leap years and month boundaries render correctly; Today uses Eastern time.
- Switching Month/List retains filters. For the same interval, both views return the same unique event set.
- Selecting a day exposes every matching event. Mobile and keyboard users can reach dates and details without relying only on color.

2 Event list

Assigned to Hani Moudarres • HaniMoudarres

Approved date-grouped event rows with shared search and filters.

Scope

A chronological, date-grouped list with keyword, club, category and date filters, a canceled-event option, result count, Month switch and export actions. Each event exposes dates, hosts, location, details and source.

Implementation

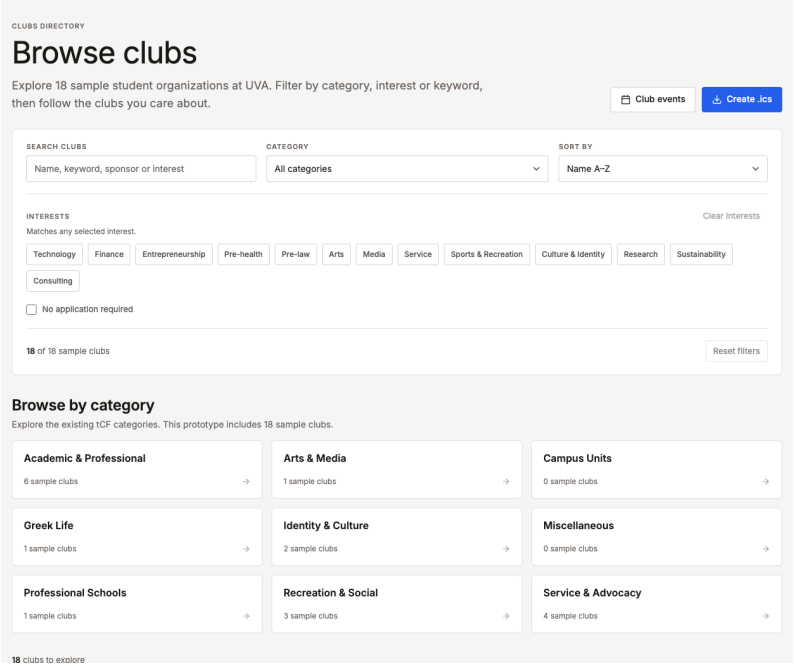

- Own the validated event form, shared queryset and detail display. Reuse paginate(), parse_mode(), with_mode(), browse_helpers.py partial-response patterns, tcf_http.js and partial_html.js.
- Keep filters in URLs and on pagination; extend update_query_params() if using repeated IDs. Apply public visibility and overlap rules once, deduplicate co-hosts, and sort by start time plus ID. Provide a detail URL as a modal fallback.

Acceptance criteria

- Every matching public occurrence appears once; private or withdrawn events are unavailable in list, detail and export.
- Filters survive view changes and Back navigation; filter edits reset pagination. Invalid dates show errors and preserve input.
- Details show full dates for overnight events. Escape closes the dialog and returns focus; empty and failed queries offer recovery.

3 Club data and categorization

Assigned to Sunny

Approved club discovery with broad categories, interests and membership filtering.

Scope

Import public Hoos Involved organizations and events. Retain nine broad categories; add interests such as Finance, Technology and Pre-health. Keep source provenance and let tCF admins correct mappings and fill gaps.

Implementation

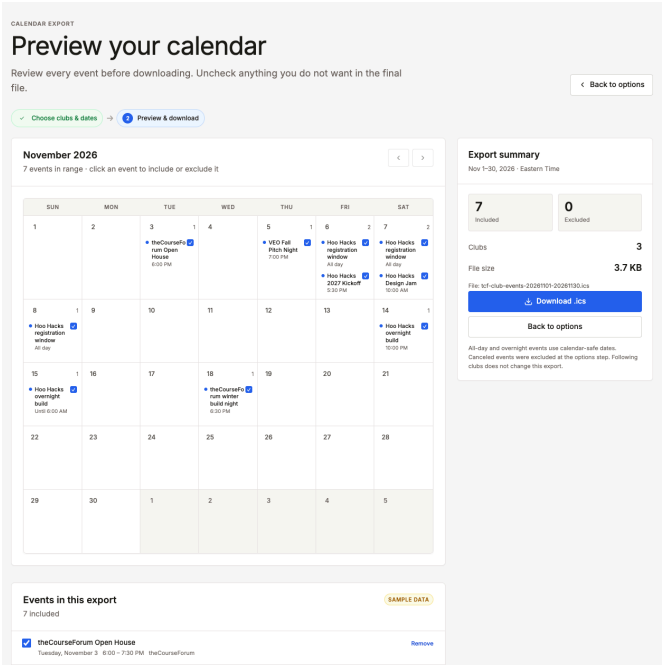

- Extend fetch_clubs and load_clubs; their current source is Presence, so add an Engage adapter after access is approved. Reuse determine_category(), get_or_create_category(), SQUASH_MAP and the shared requests_session_with_pool_and_retries() helper.
- Add event-specific fetch/load commands sharing that client. Use stable source IDs, dry-run reconciliation and atomic upserts; fix six-column CSV validation. Extend ClubAdvancedSearchForm, execute_club_advanced_search() and existing result partials for interests.

Acceptance criteria

- Repeated imports create no duplicates; renames retain Club IDs and reviews. Category changes preserve old links.
- Partial failures keep valid published data and report incomplete runs. Explicit visibility withdrawals hide affected records.
- Admin overrides survive refresh. Unknown membership does not match “No application required”; unmapped interests are reviewable in Django admin.

4 Custom calendar download

Assigned to Abhi

Approved calendar preview after choosing clubs and dates. Exclusions remain restorable.

Scope

Choose clubs and a date range, preview their combined calendar, remove individual events, restore exclusions and download an .ics snapshot. “Use followed clubs” copies the saved set explicitly; it does not create a feed.

Implementation

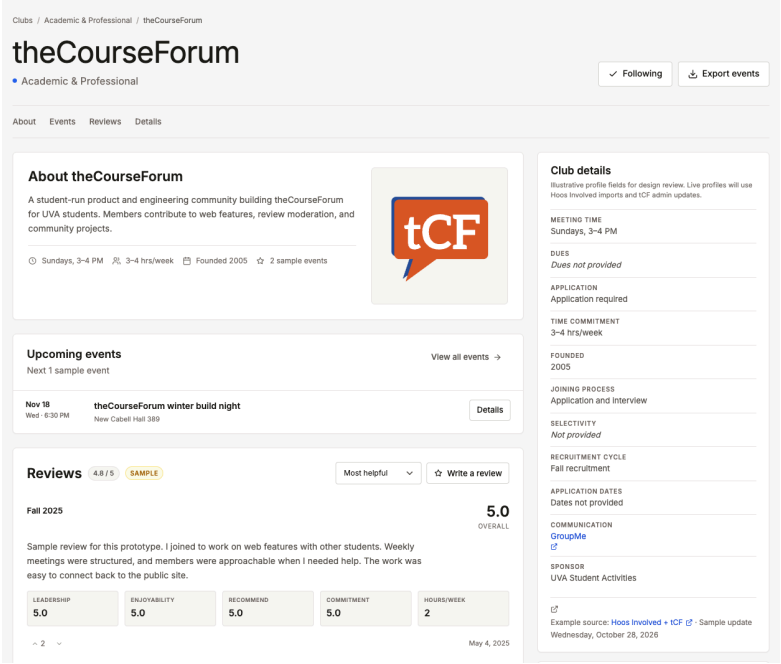

- Reuse the shared occurrence query and Hanzhe’s month component. Track exclusions by stable occurrence ID across month navigation; revalidate IDs, visibility and revisions before download. A changed event set requires review.
- Serialize one VEVENT per included occurrence with stable UID, timestamps, escaped text and valid line folding. Use UTC for timed events and exclusive DATE end values for all-day events. Default to excluding canceled events; an explicit opt-in marks them CANCELLED.

Acceptance criteria

- Co-hosted events export once. Removing/restoring events updates both preview and file; navigation retains selections.
- Invalid dates, zero clubs and an empty included set cannot download. Exports never silently add newly fetched events.
- All-day, overnight, Unicode and daylight-saving examples import correctly in Google, Apple and Outlook calendars. Explain that downloaded files do not update automatically.

5 Club profiles and saved follows

Assigned to Aryan • aryans3083

Approved enriched club profile with Follow, upcoming events and membership details.

Scope

Add sponsor, communication, time commitment, year founded, joining process, selectivity, dues and recruitment cycle/dates. Save followed clubs to signed-in accounts and show them in the private profile. Preserve existing reviews.

Implementation

- Extend _build_club_page_context(), club.html, profile() and profile.html. Retain _get_paginated_club_reviews() and ProfileForm. Extend Django admin with imported values and explicit per-field overrides.
- Reuse Cognito login, safe_next_url(), login_required and CSRF-protected POSTs. Add a unique user/club ClubFollow using the ScheduleBookmark constraint pattern. Set desired follow state explicitly; resume the requested POST after login and scope every mutation to request.user.

Acceptance criteria

- Follows survive reload, logout/login and another device. Retries create no duplicates; failed requests restore the prior UI state.
- Users cannot read or change another user’s follows. GET never mutates; account deletion removes its follows.
- Unknown values show “Not provided”; zero dues differ from unknown. Existing reviews and profile edits still work. Following creates no email subscription or personalized event feed.
